

## TABLEAU LESSON 5 – TABLE CALCULATIONS

Dataset Used: Netflix Titles Dataset

- a) Apply quick table calculations (running total, percent of total)**
- b) Create moving averages and cumulative metrics**
- c) Perform year-over-year growth analysis**
- d) Use ranking functions (Top N, Bottom N)**
- e) Implement window functions (WINDOW\_SUM, WINDOW\_AVG)**
- f) Customize addressing and partitioning**
- g) Create dynamic titles and labels using table calculations**

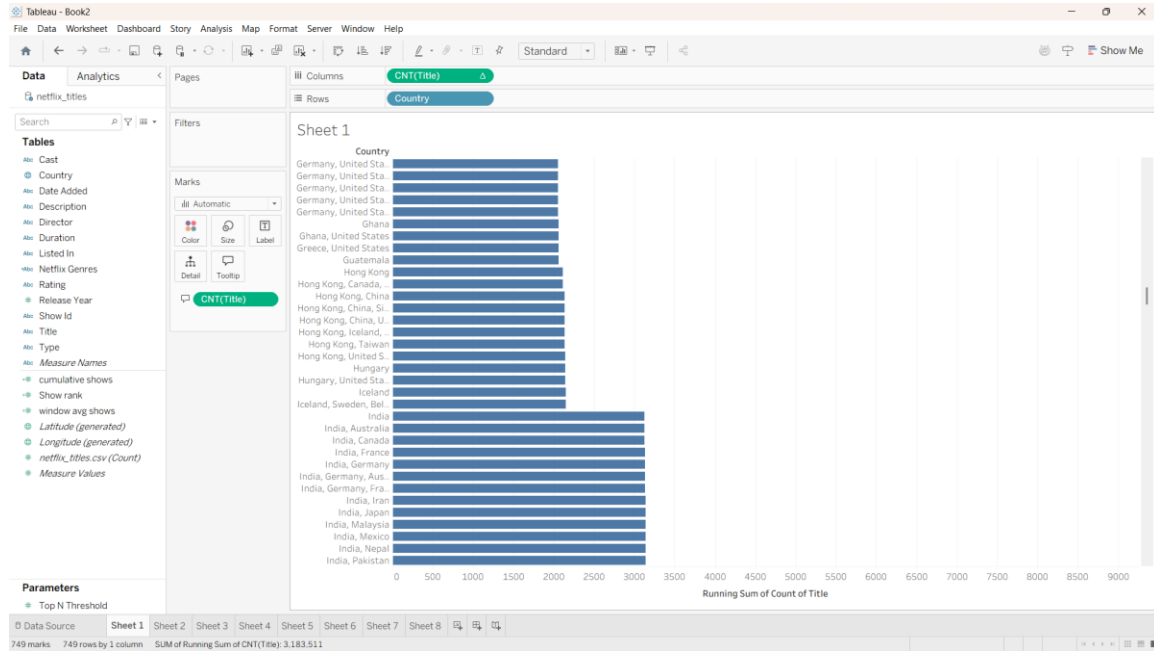

## 1. Dataset Imported

The Netflix Titles dataset was successfully imported into Tableau. The dataset contains information about movies and TV shows, including country, genre, title, and release year.

## 2. Running Total

A running total was created to display the cumulative count of Netflix titles across countries. This helps visualize the progressive growth of records.

#### 4. Moving Average

A moving average was calculated to smooth fluctuations in the number of titles released over time. This makes long-term trends easier to identify.

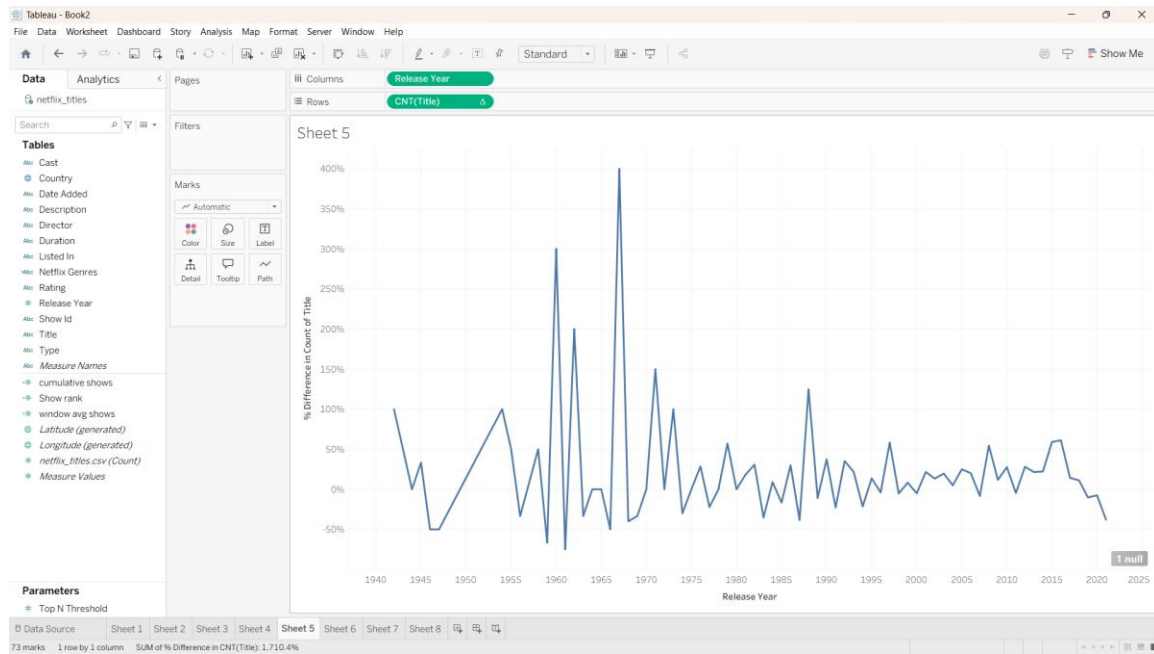

## 5. Cumulative Shows

A cumulative metric using `RUNNING_SUM` was created to display the accumulated count of Netflix titles. This provides a continuous view of growth across categories.

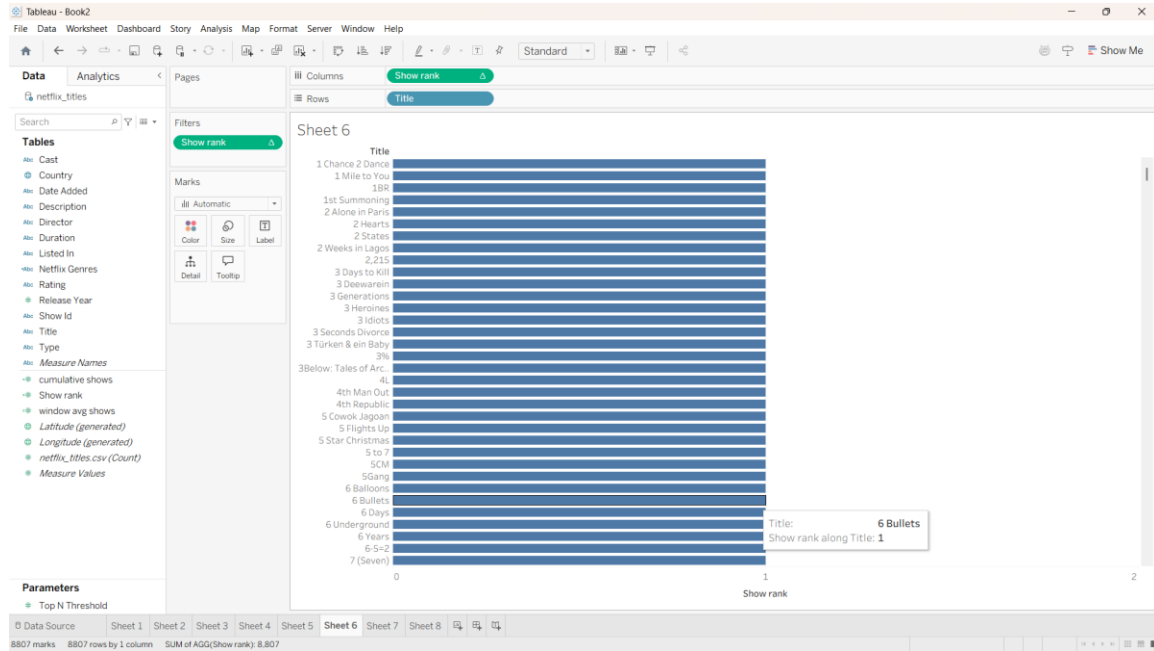

## 6. Growth Analysis

A Percent Difference calculation was used to analyze changes between periods. This helps identify increases or decreases in the number of titles over time.

## 7. Top 10 Ranking

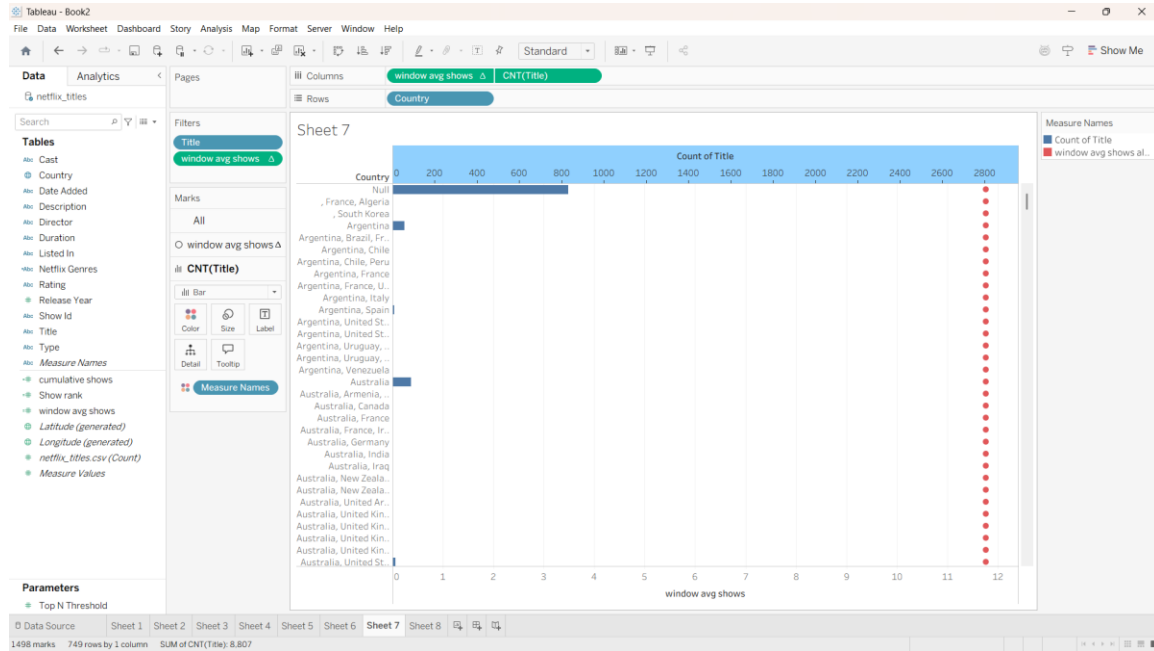

A ranking calculation was applied to identify the Top 10 categories or titles based on count. Ranking helps highlight the best-performing records.

## 8. Window Average

A WINDOW\_AVG function was used to compare individual values against the overall average. This provides a benchmark for evaluating performance across categories.

## 9. Dynamic Title

A parameter-driven dynamic title was created to automatically update based on user selections. This makes the dashboard more interactive and informative.
